

Supermarket Branch Executive Report

A concise executive brief on branch profitability, spending efficiency, and state-level performance.

Scope: 50 branches across 3 states
Total profit: \$5,600,632
Average branch profit: \$112,013
Average profit-to-spend ratio: 0.29

Executive Summary

The branch dataset shows that profit performance is not explained by budget size alone. Florida currently leads on average profit, while the strongest single branch records \$192,262 in profit. The most commercially useful lens is efficiency: some branches convert spend into profit far better than others, which creates a practical basis for benchmarking, budget review, and targeted improvement.

Top Findings

- The strongest state on average branch profit is **Florida**.
- The cost category most positively associated with profit is **Advertisement Spend** (correlation 0.97).
- The highest-efficiency branch converts total spend to profit at roughly **0.68**, materially ahead of the weakest case at **0.09**.

State Performance Snapshot

State	Branches	Avg Profit	Avg Total Spend	Avg Profit/Spend
Florida	16	\$118,774	\$449,816	0.27
New York	17	\$113,756	\$403,085	0.33
California	17	\$103,905	\$367,945	0.28

Interpretation

High-profit branches are not automatically efficient branches. A useful decision split emerges between: 1) high-profit, high-efficiency branches worth benchmarking; 2) high-profit, low-efficiency branches that may be over-spending; and 3) low-profit, high-efficiency branches that may deserve selective scaling.

Recommendations

- Benchmark branch planning assumptions against **Florida**, which leads on average profitability in this dataset.
- Prioritize review of branches with high spend but weaker profit-to-spend efficiency, because these are the clearest candidates for budget reallocation.
- Use the strongest efficiency case as an operating benchmark. The top branch by efficiency achieves a profit-to-spend ratio of **0.68**.

Method Note

This report uses descriptive analytics and simple efficiency proxies derived from advertisement, promotion, administration, and profit fields. Results are decision-support signals, not causal proof. They are best used to guide

deeper branch-level investigation and budget optimisation.
